

**Version:** 1.0.13

- Highlights:**
- ✓ Automatic text transfer (export and import)
  - ✓ Simple proofreading of the translated texts and comfortable use of spell checkers in Word
  - ✓ Column text can be selected and translated individually
  - ✓ Simple and precise count of text volume

**Features:**

<b>Export and import</b>	Text transfer (export/ import) from EXCEL-files to MS Word (*.RTF) and vice versa. <b>Translation, spell check, and replacement of terms can be done in MS Word.</b> The text can be reimported automatically into the original EXCEL-document after processing.
<b>Concatenation</b>	The integrated file concatenation function enables you to concatenate (cat) the exported RTF files into one single RTF file or into several batches and to split them again after translation. This time-saving solution is especially valuable for agencies or translators working on projects with large file numbers. <b>It is no longer necessary to open and close hundreds of files. Translation, spell check, and replacement of terms can be done in one single file.</b> Also complex Excel files can be processed easily, e.g. files with many worksheets!
<b>Select column</b>	This function allows you to define a desired column for processing. <b>Column text can be edited and translated individually.</b> It is no longer necessary to copy and paste the text from a column.
<b>Compatibility to TMS</b>	Besides the option to overwrite the texts in Microsoft Word it is also possible to translate the texts using translation tools like <b>Trados, Wordfast, DejaVu</b> or <b>SDLX</b> and to profit from the advantages of translation memory systems. Once you have finished translation, Sysfilter automatically imports the translated texts back to the original EXCEL files.
<b>Text count</b>	Import and export process are documented in a log file. This includes process information as well as <b>line and word count</b> and a <b>price calculating function.</b> Sometimes you might have found it difficult to calculate the translation price of a project including EXCEL-files. The Sysfilter count and calculation function enables you to calculate the translation price during a simple export/import process.
<b>generate count file</b>	During the export process a <b>count file without tags</b> can be generated, which you can use for counting with your usual counting tool.

**System requirements:** operating system Windows, recommended: Windows XP  
on your PC needs to be installed: MS Excel® and MS Word®

**Price:** EURO 79.00
